# DATE(S) ISSUED:

03/31/2021

#### SUBJECT:

Multiple Vulnerabilities in Google Chrome Could Allow for Arbitrary Code Execution

### **OVERVIEW:**

Multiple vulnerabilities have been discovered in Google Chrome, the most severe of which could allow for arbitrary code execution. Google Chrome is a web browser used to access the Internet. Successful exploitation of the most severe of these vulnerabilities could allow an attacker to execute arbitrary code in the context of the browser. Depending on the privileges associated with the application, an attacker could view, change, or delete data. If this application has been configured to have fewer user rights on the system, exploitation of the most severe of these vulnerabilities could have less impact than if it was configured with administrative rights.

## THREAT INTELLIGENCE:

There are currently no reports of these vulnerabilities being exploited in the wild.

# **SYSTEMS AFFECTED:**

Google Chrome versions prior to 89.0.4389.114

#### RISK:

# **Government:**

• Large and medium government entities: **High** 

Small government entities: Medium

### **Businesses:**

• Large and medium business entities: High

Small business entities: Medium

Home users: Low

### **TECHNICAL SUMMARY:**

Multiple vulnerabilities have been discovered in Google Chrome, the most severe of which could allow for arbitrary code execution. These vulnerabilities can be exploited if a user visits, or is redirected to, a specially crafted web page. Details of the vulnerabilities are as follows:

- A use-after-free vulnerability that exists in the 'screen capture' component. (CVE-2021-21194)
- A use-after-free vulnerability that exists in the 'V8' component. (CVE-2021-21195)
- Heap buffer overflow in TabStrip. (CVE-2021-21196, CVE-2021-21197)

- Out of bounds read in IPC. (CVE-2021-21198)
- Use after free in Aura (CVE-2021-21199)

Successful exploitation of the most severe of these vulnerabilities could allow an attacker to execute arbitrary code in the context of the browser. Depending on the privileges associated with the application, an attacker could view, change, or delete data. If this application has been configured to have fewer user rights on the system, exploitation of the most severe of these vulnerabilities could have less impact than if it was configured with administrative rights.

# **RECOMMENDATIONS:**

The following actions should be taken:

- Apply the stable channel update provided by Google to vulnerable systems immediately after appropriate testing.
- Run all software as a non-privileged user (one without administrative privileges) to diminish the effects of a successful attack.
- Remind users not to visit un-trusted websites or follow links provided by unknown or untrusted sources.
- Inform and educate users regarding the threats posed by hypertext links contained in emails or attachments especially from un-trusted sources.
- Apply the Principle of Least Privilege to all systems and services.
